

ABSTRACT

The present invention 10 discloses a marinating tray 12 with a plurality of vertically extending spikes 14 that allow for the placement of a meat product 16 or the like thereon to provide for an area where perforation and separation of cellular bonds may be accomplished. The present invention 10 has a plurality of spaced apart vertically extending spikes 14 and side walls 18 surrounding the periphery of the bottom tray 20 to allow for the containment of a marinade or seasoning therein and about the vertically extending spikes to produce an improved and penetrating marinating process. The present invention 10 also has a concave area 18 therein. In an alternate embodiment, the present invention 10 may take the shape of a chicken leg.
